Ideation Phase

Brainstorm & Idea Prioritization Template

Date	23 October 2026
Team ID	SWTID-2026-8980
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming encourages every team member to contribute possible solutions before selecting the most suitable approach. The ideas below are aligned with the supplied project documentation for a school IT helpdesk and its ServiceNow Flow Designer implementation.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Team collaboration: The project is considered from the perspective of a five-member third-year B.E. Computer Science and Engineering team. The team discusses common school IT support requests, the current manual ticket-classification process, and a practical way to reduce repeated work using ServiceNow configuration and Flow Designer.

Selected problem statement

The school IT helpdesk receives multiple incident requests from students and teachers, including Wi-Fi connectivity problems, projector failures, password/login issues, and slow computers. IT staff manually review each request and assign its category and subcategory. This takes time and can lead to inconsistent classification. The project aims to automatically classify a ticket from keywords in its short description and send a ticket-confirmation email to the caller.

Project objective

To configure a no-code ServiceNow Flow Designer workflow that identifies common IT ticket types, assigns the corresponding Category and Subcategory, maintains structured ticket data, and sends an email notification when a ticket is created.

Scope selected for the initial implementation

Issue keywords	Category	Subcategory
Wi-Fi / Network	Network	Wi-Fi
Projector	Hardware	Projector
Password / Login	Access	Forgot Password
Slow / Hanging	Performance	Slow Computer

Step-2: Brainstorm, Idea Listing and Grouping

The following ideas are grouped by purpose. The selected implementation items are supported by the supplied project document; ideas marked “future enhancement” are suggestions only and are not represented as completed features.

Idea group	Brainstormed idea	Status / rationale
Ticket classification	Check the short description for Wi-Fi/network, projector, password/login, and slow/hanging keywords.	Core implementation: maps the detected issue to Category and Subcategory using Flow Designer conditions.
Structured data	Use a dedicated ticket table with fields such as Caller, Category, Subcategory, Short Description, Description, State, Assigned Group, and Assigned To.	Documented configuration: supports consistent ticket records and reference/choice fields.
Choice dependency	Make the available Subcategory depend on the selected Category.	Core implementation: reduces mismatched category/subcategory combinations.
Caller communication	Send an email confirmation to the caller after ticket creation.	Core implementation: the Flow Designer email action sends a ticket acknowledgement.
Routing	Automatically assign tickets to an appropriate support group or agent.	Future enhancement: the supplied conclusion mentions assignment automation as a possible extension.
Service management	Add SLA tracking and response-time monitoring.	Future enhancement: not claimed as implemented in the current project.
Advanced classification	Explore predictive intelligence or more advanced text classification for additional issue types.	Future enhancement: the current implementation is keyword-based, not machine-learning based.

Grouped outcome: The ideas naturally fall into four groups: (1) automatic classification, (2) data consistency, (3) caller notification, and (4) optional future improvements. The first three groups define the documented project scope; routing, SLA tracking, and predictive intelligence remain possible extensions.

Step-3: Idea Prioritization

Ideas are prioritized by their relevance to the stated problem, usefulness to the helpdesk, and feasibility within the current no-code ServiceNow mini-project. This is a qualitative planning assessment, not a measured test result.

Priority	Idea	Importance	Feasibility	Decision
1 – Highest	Keyword-based Category and Subcategory assignment in Flow Designer	High: directly addresses manual classification.	High: implemented through configured flow conditions and record updates.	Include in current project
2 – High	Automated email confirmation to the caller	High: confirms that the request was submitted.	High: uses the documented Send Email action.	Include in current project
3 – High	Dependent Category/Subcategory choices and structured ticket fields	High: supports consistent data entry and records.	High: uses table fields, choice values, and dependent-field configuration.	Include in current project
4 – Medium	Automatic assignment to a support group or agent	Medium: could improve routing after classification.	Not assessed in the current implementation; needs additional configuration.	Future enhancement
5 – Medium	SLA tracking and response-time monitoring	Medium: could support service-level monitoring.	Requires additional design and configuration.	Future enhancement
6 – Later	Predictive / AI-based classification	Potentially useful for a broader set of issue descriptions.	Beyond the documented keyword-based scope.	Future enhancement

Prioritization conclusion

The team prioritizes keyword-based classification, consistent category/subcategory data, and caller email notification because these directly address the stated problem and match the documented ServiceNow workflow. Automatic assignment, SLA tracking, and predictive classification are retained as future ideas rather than current deliverables.

Source basis: Project-specific details were taken from the supplied “Auto Ticket Classification using Flow Designer” documentation. The project documentation describes keyword-based Flow Designer conditions, category/subcategory updates, dependent choice fields, email notification, and possible future extensions.
