Ideation Phase

Empathize & Discover

Date	23 October 2026
Team ID	SWTID-2026-8980
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Empathy Map Canvas

Primary user: School IT helpdesk staff member. Secondary users: students and teachers who submit IT support tickets. This map reflects the needs implied by the supplied project description; it is not based on a separately conducted user interview or survey.

SAYS	THINKS	DOES	FEELS
• “I receive many IT support tickets every day.” • “I need to identify each issue and choose the correct category.” • “Common issues include Wi-Fi, projector, password and slow-computer problems.”	• “How can I classify tickets faster and consistently?” • “Will the category and subcategory match the reported issue?” • “Can routine manual work be reduced?”	• Reviews each incoming ticket. • Reads the short description and issue details. • Selects a category and subcategory. • Handles ticket records and communicates with the caller.	• May feel pressed for time when ticket volume increases. • May be concerned about incorrect or inconsistent classification. • Wants a reliable and manageable process.

PAINS / CHALLENGES	GAINS / NEEDS
• Manual review takes time. • Tickets may be categorized inconsistently. • Repeated routine work can slow ticket handling as requests increase.	• Automatic category and subcategory assignment based on issue keywords. • Consistent, structured ticket records. • Email confirmation to the caller after ticket creation. • A no-code flow that is easier to maintain.

Secondary User Perspective

Students and teachers submitting an IT support ticket

SAYS	THINKS	DOES	FEELS
• “My Wi-Fi is not working.” • “The projector is not turning on.” • “I cannot log in or I forgot my password.”	• “Has my request been recorded?” • “Will the helpdesk understand the issue correctly?” • “When I submit a ticket, I want confirmation.”	• Reports the issue using the ticket form. • Provides a caller name and short description. • Submits the request and checks for acknowledgement.	• May be uncertain until the request is acknowledged. • Wants the issue to be understood correctly. • Values a clear confirmation message.

Design implications for the project

1. Trigger the flow when a new ticket record is created and its Category is empty.
2. Check short-description keywords and update the Category and Subcategory for the four documented issue groups: Network/Wi-Fi, Hardware/Projector, Access/Forgot Password, and Performance/Slow Computer.
3. Send an email confirmation to the caller using the Flow Designer email action.
4. Use dependent choice configuration so Subcategory options align with Category.

Source note: The workflow and issue categories above follow the supplied project documentation. User statements, thoughts, and feelings are reasoned empathy-map entries for design discussion, not quotations from actual interviews.
