Project Design Phase
Solution Architecture

Date	23 October 2026
Team ID	SWTID-2026-8980
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Solution Architecture Diagram:

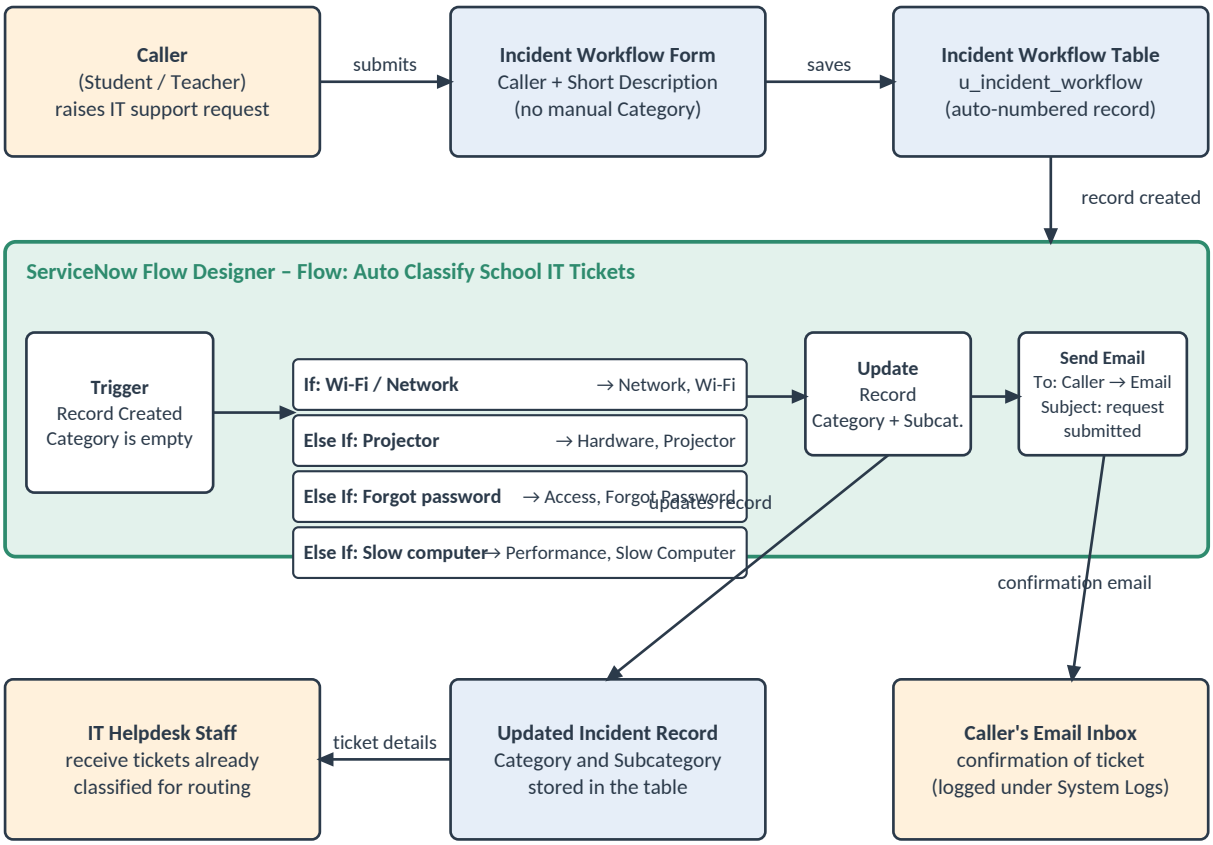

Figure 1: Architecture and data flow of the Auto Ticket Classification using Flow Designer solution

Architecture Components:

Component	Role in the solution
Incident Workflow table	Custom table (u_incident_workflow) that stores tickets. Fields: Number (auto number), Caller, Category, Subcategory, Short Description, Description, State, Assigned Group and Assigned to.

Component	Role in the solution
Dependent choice fields	Subcategory options depend on the selected Category: Network → Wi-Fi, Hardware → Projector, Access → Forgot Password, Performance → Slow Computer.
Flow Designer flow	“Auto Classify School IT Tickets” runs when a record is created and Category is empty. If / Else If conditions on the Short Description keywords call Update Record to set Category and Subcategory.
Send Email action	After classification, an email is sent to the Caller’s email address with the subject “Your Request for the issue has been submitted.”
Update Set	Project Update Set (Global scope) captures the configuration; it is marked Complete and exported as XML for deployment to other instances.
